FRAGRANCES EMBEDDED IN POLYMERS

Fine fragrances

Ephemeral &
unpredictable

“The strongest type of perfume, **Eau de Parfum** contains between **10-20%** of perfume oil, and will generally last around **8 hours**.

Eau de Cologne, on the other hand, has only around **2-4%** of perfume oil, and doesn't last longer than **2-3 hours**.”

“The **pH balance** of the skin differs slightly, which can **change the way a scent smells**.”

C ONCEPT.

Aromety is the solution to both perfume alteration and durability issues.

Embedded in a wearable solid polymer, the fine fragrance will not be altered by the pH of the skin and will smell the same in everyone.

Additionally, thanks to our technology, each polymer has a durability of 1 week, with a linear fragrance diffusion throughout its lifetime.

Our Know-How.

Polymers and fragrances are very **incompatible** when it comes to homogenisation and production process. Why?

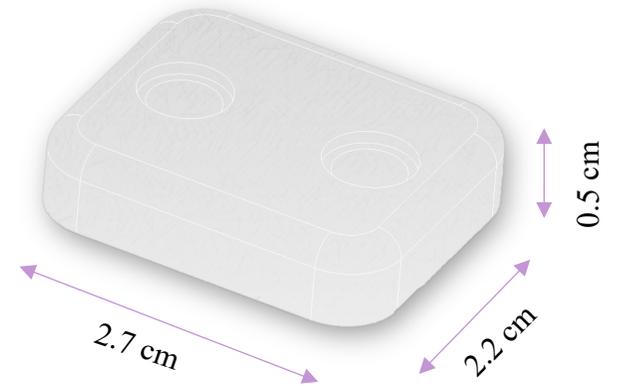

- * Polymers tend to have **solid states** while that of fragrances is **liquid**.
- * Injection moulding machines **do not accept liquids** as raw materials.
- * Polymers do **not absorb** fragrances or essential oils and, if they do, it is in a very **low percentage**.

At Scent Emotions we have developed our **own unique technology** to manufacture various polymeric compounds capable of containing large amounts of fragrance (up to **50%**).

One of the main characteristics of our technology is that both manufacturing and injection processes are done at **low temperatures**. This ensures that the **volatile compounds** of fragrances are **not destroyed** which, in most cases, makes the original fragrance unrecognisable.

TECHNICAL DETAILS.

- * Each solid pad contains **0.9 – 1 gr of fragrance**, which equals 50 fragrance sprays.
- * Duration is approximately **5 – 10 days**.
- * Snap mechanism for solid pad subjection.
- * **Patented** technology.
- * Dimensions:
